#### **Computer Project Extras**

### **Program 1:**

#### **VDT**

Datatype	Name	Purpose	Scope
long	n	Inputted variable	number()
long	format	Generated number	number()
int	i	Loop control variable	number()
long	сору	Temporary variable	number()
int	С	counter	number()
String	sentence	Inputted sentence	palin()
String	word	Extracted word	palin()
String	rev	Reversed word	palin()
int	count	counter	palin()
int	i	Loop control variable	palin()

Return Type	Signature	Purpose
void	number()	Remove duplicate variable in a number
void	palin()	Print all the palindrome words in a sentence

# Program 2:

# **VDT**

Datatype	Name	Purpose	Scope
int	n	Inputted number	accept()
int	n	Formal parameter	decitobi()
int[]	binary	Storing digits of binary number	decitobi()
int	pos	Position of array	decitobi()
int	i	Loop control variable	decitobi()
int	n	Formal parameter	decitooctal()
int[]	octal	Storing digits of octal number decitooc	
int	pos	Position of array	decitooctal()
int	i	Loop control variable decitod	
String[]	hex	Storing digits of hexadecimal number decitoh	
int	pos	Position of array decitohex	
String[]	hexDigits	Initialising hexadecimal digits decitohex()	
int	i	Loop control variable decitohex()	

Return Type	Signature	Purpose
void	accept()	Control the other methods
void	decitobi(int n)	Convert decimal to binary
void	decitooctal(int n)	Convert decimal to octal
void	decitohex(int n)	Convert decimal to hex

# **Program 3 (Student):**

### **VDT**

Datatype	Name	Purpose	Scope
int	roll	Roll number of student	Student
String	name	Name of student	Student
Dates	dob	Date of birth of student	Student
int	age	Store the age of student	display()
int	age	Calculate the age	calculateAge()
int	dd	Date	Student>Dates
int	mm	Month	Student>Dates
int	уу	Year	Student>Dates

Return Type	Signature	Purpose	
void	accept()	Accept data	
void	display(Dates currentDate) Display data		
int	calculateAge(Dates dob, Dates currentDate)	Calculate age of the	
		student	
void	accept()	Accept data	
void	display()	Display data	

# Program 4:

# <u>VDT</u>

Datatype	Name	Purpose	Scope
int	base	Base number of series	Program4
int	power	Power of term	Program4
double	sum	Sum of series	Program4
double	term	Term of series	series1()
double	factorial	Factorial of n	series1()
int	i	Loop control variable	series1()
double	sign	Positive or negative control	series2()
double	term	Term of series	series2()
int[]	fib	Array to store n number of consecutive	series2()
		Fibonacci numbers	
int	i	Loop control variable series2()	
int	choice	Choice of user	main()

Return Type	Signature	Purpose
void	input()	Input data members
void	series1()	Generate sum of first series
void	series2()	Generate sum of second series
void	main()	Control other methods

# Program 5:

# **VDT**

<u>Datatype</u>	<u>Name</u>	<u>Purpose</u>	<u>Signature</u>
String	<u>rev</u>	Reversed text	reverse()
<u>int</u>	<u>i</u>	Loop control variable	reverse()
String[]	<u>arr</u>	Storing reverse of ASCII of letters	main()
String	word	Formation of word	main()
int	<u>i</u>	Loop control variable	main()

# <u>MDT</u>

Return Type	<u>Signature</u>	<u>Purpose</u>
String	reverse()	Reverse a String
void	main()	Control the the functioning of the class

# Program 6 (Time):

# <u>VDT</u>

<u>Datatype</u>	<u>Name</u>	<u>Purpose</u>	Scope
int	<u>hh</u>	Hour	<u>Time</u>
int	<u>mm</u>	Minute	<u>Time</u>

Return Type	Signature	<u>Purpose</u>
void	readtime()	Enter data members
<u>Time</u>	addTime(TimeX)	To add two time values
<u>Time</u>	diffTime(Time X)	To subtract two time values
void	disptime()	<u>Display time</u>
void	main()	Control other methods

# Program 7:

# **VDT**

Datatype	Name	<u>Purpose</u>	Scope
<u>String</u>	sentence	Inputting the sentence from user	main()
<u>String</u>	word	Extracting word	main()
String	<u>format</u>	Forming new sentence	main()
<u>int</u>	<u>i</u>	<u>Outer loop</u>	main()
int	j	<u>Inner loop</u>	main()
String	<u>s1</u>	Storing only vowels of the extracted word	main()
<u>String</u>	<u>s2</u>	Storing only consonants of the extracted	main()
		word	

Return Type	Signature	Purpose
void	main()	Main functioning of the program

# **Program 8 (Sentence):**

# <u>VDT</u>

Datatype	<u>Name</u>	<u>Purpose</u>	Scope
String	<u>WD</u>	Word to search	<u>Sentence</u>
String	<u>sen</u>	Inputted sentence	Sentence
String[]	<u>arr</u>	Storing extracted words	<u>Sentence</u>
<u>int</u>	<u>C</u>	Counting words	Sentence()
<u>int</u>	<u>i</u>	Loop control variable	Sentence()
String	<u>word</u>	Extract words	extract()
<u>int</u>	<u>C</u>	Counter	extract()
<u>int</u>	<u>i</u>	Loop control variable	extract()
<u>int</u>	<u>i</u>	<u>Outer loop</u>	sort()
<u>int</u>	j	<u>Inner loop</u>	sort()
<u>String</u>	<u>temp</u>	Temporary variable	sort()
<u>int</u>	<u>L</u>	<u>Left control</u>	search()
<u>int</u>	<u>r</u>	Right control	search()
<u>int</u>	<u>m</u>	<u>Middle term</u>	search()
<u>int</u>	<u>f</u>	<u>Flag variable</u>	search()

Return Type	<u>Signature</u>	<u>Purpose</u>
void	extract()	Extract words and store them in the array
void	sort()	Sort the words lexicographically
void	search(String word)	Search a word given as input by the user
void	<u>create()</u>	To control other methods

### **Program 9:**

# **VDT**

<u>Datatype</u>	Name	Purpose	Scope
String[]	<u>a</u>	Store words of a sentence	Program9
String[]	<u>b</u>	Store the piglatin form of the words	Program9
<u>int</u>	<u>i</u>	Loop control variable	input()
String	<u>format</u>	Form the piglatin words	convert()
<u>int</u>	<u>i</u>	Loop control variable	convert()
int	<u>i</u>	Loop control variable	change()
int	<u>i</u>	Loop control variable	display()

Return	<u>Signature</u>	<u>Purpose</u>
<u>Type</u>		
void	input()	Input data members
String	convert(String p)	Convert words into piglatin form
void	<u>change()</u>	Store converted words in array b[]
void	display()	<u>Display data members</u>
void	main()	To control other methods

# Program 10 (Search):

# <u>VDT</u>

<u>Datatype</u>	Name	<u>Purpose</u>	<u>Scope</u>
String	<u>a</u>	Sentence A	<u>Search</u>
String	<u>b</u>	Sentence B	<u>Search</u>
String	<u>a</u>	Sentence A	Search()
String	<u>b</u>	Sentence B	Search()
String	wordA	Extract words from sentence A	<u>find1()</u>
String	<u>wordB</u>	Extract words from sentence B	<u>find1()</u>
<u>int</u>	<u>i</u>	Outer loop	<u>find1()</u>
<u>int</u>	j	<u>Inner loop</u>	<u>find1()</u>
String	word	Extract words from Sentence A	<u>find2()</u>
String	maxword	Store the longest word	<u>find2()</u>
<u>int</u>	<u>maxlen</u>	Store the length of the longest word	find2()
int	<u>i</u>	Loop control variable	find2()

Return Type	<u>Signature</u>	<u>Purpose</u>
void	find1()	Find the common words in both the sentences
void	find2()	Find the longest word in sentence A
void	test()	Control other methods

# Program 11:

# **VDT**

Datatype	<u>Name</u>	<u>Purpose</u>	Scope
int[]	<u>a</u>	Store the elements each row	Program11
<u>int[][]</u>	<u>b</u>	Input the matrix	Program11
<u>int</u>	row	Store the number of rows	Program11
<u>int</u>	col	Store the number of columns	Program11
<u>int</u>	i	<u>Outer loop</u>	input()
<u>int</u>	j	<u>Inner loop</u>	input()
<u>int</u>	<u>i</u>	<u>Outer loop</u>	sort()
<u>int</u>	j	<u>Inner loop</u>	sort()
<u>int</u>	<u>t</u>	Temporary variable	sort()
<u>int</u>	<u>i</u>	<u>Outer loop</u>	extract()
<u>int</u>	j	<u>Inner loop</u>	extract()
<u>int</u>	<u>i</u>	<u>Outer loop</u>	<u>display()</u>
<u>int</u>	j	<u>Inner loop</u>	<u>display()</u>
<u>int</u>	<u>i</u>	<u>Outer loop</u>	square()
<u>int</u>	j	<u>Inner loop</u>	square()
<u>int</u>	<u>k</u>	Temporary variable	square()
<u>int</u>	<u>t</u>	Space counter	square()
<u>int</u>	<u>p</u>	Space loop	square()

Return Type	Signature	Purpose
<u>void</u>	input()	Input data members
<u>void</u>	sort()	Sort the array a[]
<u>void</u>	extract()	Sort each row in the matrix
<u>void</u>	display()	Display the matrix
void	square()	Print the pattern
